96501 Master Interface Board

96720 Master Termination Board

Description

96501

This board is installed in a 9600 master to provide connection for 24 substations. It provides the call-in signaling and audio path for conversation with the substations. It has connection for the 9672 termination board when used. It also provides connections for the 9680 amplifier. Up to four of these boards can be connected to a basic 9600 master. This board also has dip switches for the board address, and these must be set according to its position within the master. These are normally installed at the time of assembly of the master or when expanding the unit.

96720

This is a single master termination board. It provides the current loop to the substations when only one master is connected to a set of substations. The board is mounted on the rear of an 9650X substation board. It requires 30 VDC which it gets from the master's power supply (96900). These are normally installed at the time of assembly of the master or when expanding the unit.
