

## STENTOFON 9653 Master Interface Board

### Functional Description

When connecting a 9600 master to another 9600 master in a "remote master" configuration, the 9653 master interface board is required at each end. In this application the two masters function as a mirror image of each other. This allows installing one of the masters with the substation in a remote location. Connect this master via audio and data to the second master. The calls can now be answered from this second master at main control.

If you wish to connect a 9600 into a network of 9200's, the 9653 interface board is required in the main 9600 master. In this case the calls are again routed to the 9600 but up to 8 of the 9200's can be installed in a multi-drop configuration.

In both applications you need four-wire audio between the out laying equipment and the main control center. For additional information, contact Zenitel's technical service department.
